The proposed circuit can be considered almost a perfect DC motor speed controller. It is basically a PWM (Pulse Width Modulated) motor driver that incorporates two separate stages for the generation of the pulses. An external variable DC voltage source is effectively

Speed Reduction in geared DC Motor. Sometimes the objective of using a gear motor is to reduce the rotating shaft speed of a motor in the device being driven, for example in a small electric clock where the tiny synchronous motor may be turning at 1,200 rpm however is decreased to one rpm to drive the

12-3 shows a picture of a typical electric dc motor stator. From the picture in Fig. 12-2 you can see the armature is made of coils of wire wrapped around the core, and the core has an extended shaft that rotates on bearings.
